

OUT OF HIS SKULL

FX legend introduces the world's first strap-mounted effects controller. And it's skull-shaped

Roger Mayer's new **Skull Controller** is a strap-mounted sterling silver skull that controls your effects set-up and could change the way we guitarists trigger effects onstage forever.

The Skull Controller sends radio signals to a unit on the floor in order to provide control of the effects chain. Promising that, "full technical details will be available soon," Mayer

outlines that the unit, "can be pressed on each end to provide two independent commands that provide two separate bypass paths in the receiver to put the various effects in and out of the chain. This will, of course, free up the guitar player from returning to the pedal board and searching out the right pedals for a solo. It will thus give total stage movement freedom when used with a guitar radio link.

"One receiver can be programmed to learn and operate from different transmitters, so more than one controller can be used in a performance without changing your strap from guitar to guitar." Intriguing. Contact Roger Mayer via e-mail at info@roger-mayer.demon.co.uk, or online at www.roger-mayer.co.uk
